What is ThermiRF?

ThermiRF is the first aesthetic technology that uses thermistor-regulated radio frequency energy to achieve desired cosmetic results.

The ThermiRF system uses a tiny treatment probe to gently heat specific tissues to a pre-determined therapeutic temperature. After the procedure, a gentle wrap is applied and the patient may resume normal activities the next day.

Precise and Safe

ThermiRF provides a truly precise and safe delivery system that acutely directs the proven science of tissue heating to therapeutic targets to produce meaningful and safe cosmetic results.

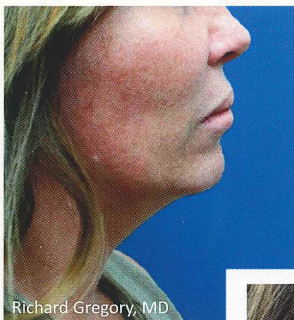

- ***Painless***
- ***Single Treatment Solution***
- ***Little to No Downtime***
- ***Quick, Easy Procedure***

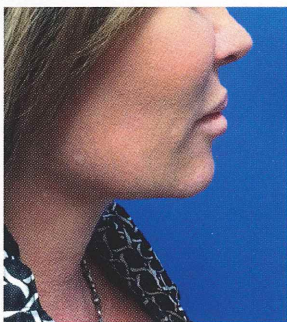

How It Works

With ThermiRF, your surgeon applies a controlled amount of thermal energy to targeted tissue. The tip of the tiny probe provides constant feedback of the actual temperature during treatment.

In addition, an infrared camera is used to monitor skin temperature to ensure that your treatment is both safe and effective.

A Solution for You

Through the years, our face and body begin to reveal the signs of aging - frowning, wrinkling, bulging or sagging. Although there is a wide spectrum of cosmetic solutions focused on reversing these signs, patients increasingly gravitate towards those solutions that deliver results superior to non-invasive or over-the-counter treatments, but absent the risks associated with invasive surgery.
